Adobe Photoshop 12 What's new? Working with software that's been around for so long can be an intimidating task for a beginner, but it's much easier than you might think! This guide will teach you the key features of this image-editing program so that you can tweak any photo you want to make it look better. I have to start with the caveat that just because a feature exists doesn't mean it's easy to use. Photoshop's menus can be either intimidating or useless, depending on which functionality you want to learn. (The menus can be accessed with the keyboard combination Ctrl-K or by pressing the down key while holding down Ctrl.) In this guide, I'll assume you have Photoshop CS6 or greater. Other versions of Photoshop may have different instructions, so check to see if you need to download a different version. Viewing the photo The first step in any editing process is to view the photo you want to work with. You could, of course, start at the step in which you want the photo to appear. However, I find it easier to work with a photo in just the place that I want it to appear on the page. Photoshop makes this easy. Double-click the photo thumbnail in the thumbnail bar at the bottom of the image window to display the Adjustments panel, which is the first step in working with the photo. The following steps will work with the Adjustments panel open. If you want to return to the thumbnail view, click the little triangle at the bottom right of the thumbnail view. Using Photoshop to enhance an existing photo A photoshop landscape image The first step to editing a photo is to select an adjustment layer and modify it by adjusting its properties. I'll call the filter retouching, though you could also use exposure, curves, etc. You can change any of the following properties in an adjustment layer's properties panel: Color Brightness Contrast Hue/saturation Opacity Select an adjustment layer With the image window selected, you can change the image by doing the following: Open the Layers panel by pressing the F key on your keyboard. Shift-click or Ctrl-click on the layer you want to change. The name of the layer appears in the Layers panel. Click the rightmost plus
